Lighting Basic Concept

照明基本概念

Lumen　流明

Lumen 實際上是代表著光的強度, 也就是光通量(Luminous flux)即指光源在某單位時間內所發出之光線總數量。一般稱作光束)的單位, 簡而言之, 流明就是光束照在物體表面的量。
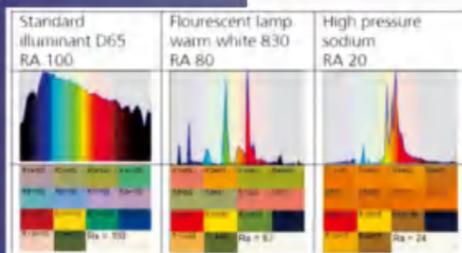

Lumen actually represents the intensity of lights. that is, the luminous flux(Luminous Flux) refers to the unit of the total amount of light emitted by alight source in a unit time, generally referred to as the light beam. In short, lumens is the light beam Amount on the surface of the object.

Color Rendering Index
顯色性指數

顯色度以Ra來表示, 天然光的顯色度為100Ra, 顯色度越接近100Ra, 我們看到的顏色就越接近物體的自然原色。也就是顏色逼真的程度, 顯色度高 我們所看到的顏色也就是較接近自然原色, 顯色度低對於顏色的表現較差, 所看到的顏色偏差也延遲。

Color rendering is represented by Ra, the color rendering of natural light Is 100 Ra, the closer the color rendering is to100 Ra, the color we see The closer the color is to the natural primary color of the object. Color is realistic The degree of color rendering is high. The color we see is close to natural primary color, low color rendering, poor performance for color, The color deviation seen is also delayed.

Color Temperature　色溫

色溫及不同色溫應用什麼環境——以絕對溫度 K(kelvin)來表示, 色溫度 3000k以下時, 光色有偏紅的現象(黃光), 給予一種溫暖、親切、舒適的感覺; 色溫度超過5000k時, 顏色則偏向藍光(白光), 給人一種清冷的感覺, 令環境變得清零和寧靜。

通常亞熱帶人較喜歡清冷 4000k以上, 而寒帶的人較喜歡 4000k以下的色溫度。

Color temperature and what environment is used for different color temperatures-expressed in absolute temperature K (kelvin), when the color temperature is below 3000k, the light color has a reddish phenomenon (yellow light), giving a warm, friendly, comfortable feeling; color temperature exceeds 5000k At this time, the color is biased towards blue light (white light), giving a cool feeling. Make the environment clear and peaceful.

Generally, people in the subtropics prefer cold temperatures above 4000k, while those in the cold regions prefer colors below 4000k.

WB SETTINGS	COLOR TEMPETATURE	LIGHT SOURCES
	10000-15000K	Clear Blue Sky
	6500-8000K	Cloudy Sky / Shade
	6000-7000K	Noon Sunlight

Life　壽命

分為平均壽命和經濟壽命兩種, 以小時為單位。

平均壽命 (rate average life)

例如, 每個100個燈泡同時亮著, 若6000小時後, 第50個燈泡壞掉熄滅, 此燈泡的平均壽命則為6000小時 。

經濟壽命 (economic life)

指流明輸出的總時數

以上, 燈的光通維持率達到標準規定的要求並能繼續燃點至50%的燈(即50%的燈失效時的壽命), 同時考慮損壞以及光束輸出衰減的狀況下能維持光源為70%以上。

Divided into two types of average life and economic life, in hours.

Life expectancy (rate average life)

For example, each of the 100 light bulbs is on at the same time. If after 60,000 hours, The 50th lamp is broken and extinguished, and the average life of the lamp is 6000 hours.

Economic life

Economic life refers to lumen output.

The above, The lumen maintenance rate of the indicator lamp meets the requirements of the standard that can continue burning point to 50% of lamps (ie, that point at 50% of lamp fails). Taking into account for the damage, lumen output decay, it can maintain light source at 70% healthy condition.

Fire Proof Material　物料防火等級

塑料阻燃等級由 HB, V-2, V-1向V-0逐級遞增。

HB: UL94標準中最低的阻燃等級, 要求對於3到13毫米厚的樣品, 燃燒速度小於 40毫米每分鐘; 小於 3毫米厚的樣品, 燃燒速度小於 70毫米每分鐘; 或者在 100毫米的標誌前熄滅。

V-2: 對樣品進行兩次 10秒的燃燒測試後,火焰在 30秒內熄滅,可以引燃 30cm下方的藥棉。

V-1: 對樣品進行兩次 10秒的燃燒測試後,火焰在 30秒內熄滅,不能引燃 30cm下方的藥棉。

V-0: 對樣品進行兩次 10秒的燃燒測試後,火焰在 10秒內熄滅,不能有燃燒物掉下。

94V-0

Plastic flame retardant grades are gradually increased from HB, V-2, V-1 to V-0.

HB: The lowest flame retardant grade in the UL94 standard, Require for 3 to 13mm thick samples with a burning rate of less than 40 mm per minute; less than 3 mm thick samples with a burning rate of less than 70 mm per minute; or stop at 100 mm sign.

V-2: After two 10-second burn tests on the sample, the

flame stops at 30 seconds, would ignite cotton wool below 30cm.

V-1: After two 10-second fire tests on the sample, the flame was at 30 seconds Inside goes out. Would not ignite cotton wool below 30cm.

V-0: After two 10-second burn tests on the sample, the flame stops at 10 seconds. No burning substances should fall off.

Stroboscopic Suppression 頻閃抑制

理想的光源亮度是鎮流後之直流電壓恆定不變的,這就是理論上的絕對無頻閃。實際上我們平常使用的燈具直流電壓都不會真正的恆定不變,週期的亮度高低變化程度就是頻率。

市面常見LED驅動電路,頻閃深度最大的頻率一般都是100HZ左右。因為PWM高頻是調製在50HZ整流後的電壓

上。實際燈具中,任何的頻率上都會有一定的頻閃深度 (最亮的亮度和最暗的亮度之差)。那麼,這裡就存在一個頻閃深度最大的時候所對應的頻閃頻率。還有就是最大的頻閃深度值。

頻閃頻率越高對人的影響越小,頻閃深度越小對人的影響越小,總體來說頻閃深度越小對人降低或消除導致視力疲勞的低頻率光光,減輕眼睛負擔,關愛眼睛。

Ideal light source brightness is constant, which is absolute no stroboscopic depth. In fact, the brightness of the lamps we usually install will not be truly stable. The degree of change in the brightness within the period is the frequency.

The common LED drive circuit in the market has the stroboscopic depth at frequency100 HZ or so. This is because PWM high frequency is modulated on the voltage after 50 HZ rectification. In actual lamps, there will be a certain stroboscopic depth at any frequency. (The difference between the greatest brightest and smallest brightness). Well, there would be the strobe frequency corresponding to the maximum stroboscopic depth, that has the biggest strobe depth value.

The higher the strobe frequency , the smaller the impact is on peoples. As a consulsion, the lower the stroboscopic depth can reduce or eliminate low-frequency light vision fatigue that reduces the burden on the eyes and cares about eye health.

Glare 眩光

是指視野中由於不適宜亮度分佈,是因視野內的亮度大幅超過眼睛所適應,以致引起視覺不舒適和降低物體可見度的視覺條件。視野內產生人眼無法適應之光亮感覺,可能引起厭惡、煩擾、不舒服或視力受損不舒服、甚或喪失明視度。在視野中某一局部地方出現過高的亮度或前後發生過大的亮度變化。
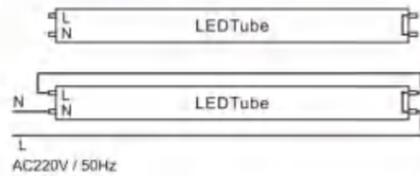

眩光是引起視覺疲勞的重要原因之一。

Refers to the unsuitable brightness distribution in the visual field, resulting in visual discomfort and reduced object visibility Visual conditions. There is a discomfort feeling in the eye vision that a person cannot withstand that would cause disgust, discomfort or even loss of vision. Excessive brightness in a special location of vision, or excessive brightness changes.
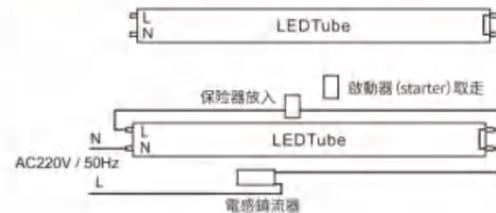

Glare is one of the important causes of visual fatigue.

Power Factor 功率因數

功率因數 (簡稱PF),是一負載所消耗的有功功率與其視在功率的比值,純電阻負載的視在功率等於有功功率,其功率因數為1。若是由電感、電容及電阻組成的負載,功率因數會小於1。

功率因數在一定程度上反映了發電機容量得以利用的比例,是合理用電的重要指標。功率因數的高低,對於電氣設備的利用率和分析、研究電能消耗等問題都有十分重要的意義。電力公司為了反映較大容量設備及浪費能量的成本,一般會對功率因數較低的工商業用戶以較高的電費費率來計算電費。

Power factor (referred to as PF), is a load consumed by the active power and its apparent power ratio, pure resistance load apparent power is equal to the active power, its power factor is 1. If the load is composed of inductance, capacitance and resistance, the power factor will be less than 1.

Power factor to a certain extent reflects the proportion of generator capacity to be utilized, is an important indicator of rational use of electricity. The level of power factor, for the utilization of electrical

equipment and analysis, research and power consumption and other issues are of great significance. In order to reflect the cost of larger capacity equipment and wasted energy, the power company will generally lower power factor of industrial and commercial users to higher rates to calculate the electricity bill.Translated with DeepL.com (free version)
